

Abstract of the Disclosure

This invention relates to a method for transferring data from a source application to a target application. From the application an operation is traced, from which operation at least one item is extracted. The item is saved in a trace log file, from which it can be selected and transferred into said target application. The operation can be e.g. incoming or outgoing call, where the item is a phone number or a contact card. The invention relates also to a device, to a system and to computer program product.
